Bar Chart  
3/21/2019

**Unique Games Nintendo Published per Nintendo Platform as of December 2016**

For the Bar Chart, the data came from the collection of unique video games sold up until December of 2016. From this, I narrowed it down to just games Nintendo published, otherwise there would be simply too much data with little correlation between them all. This is why I broke the graph data by companies. This works as a bar chart due to the quantitative variable (number of games) versus a qualitative variable (Nintendo platform). This allows the viewer to see the variation in number of games sold per platform.

Looking at the the data plotted, it appears that the most number of games that were released overall on Nintendo's platform were on the DS where as the least released were on the SNES. From this we can speculate what a possible reasoning is for this. There could be a correlation between the lifespan of the two systems while on the market or possibly a correlation between the two systems' abilities to be cross-compatible with another system's games. These are speculations, however, and cannot be drawn completely from the datatable being used.
